

**COSMETIC FORMULATION COMPRISING AT LEAST TWO ACTIVE
MATERIALS IN A MULTIPLE EMULSION OPTIONALLY MIXED WITH
A SIMPLE EMULSION**

5

Abstract of the Disclosure

The invention concerns a cosmetic and/or dermatological composition comprising at least two active substances
10 in a multiple emulsion consisting of an internal aqueous phase dispersed in an internal oily phase, the whole being dispersed in an external aqueous phase, the multiple emulsion being optionally mixed with a single emulsion consisting of an external oily phase dispersed
15 in an external aqueous phase: the internal oily phase comprising at least one nonionic surfactant and/or at least one amphiphilic polymer and optionally at least one hydrophobic active substance; the external aqueous phase comprising at least one nonionic surfactant
20 and/or at least one nonionic amphiphilic polymer optionally associated with at least one anionic amphiphilic polymer or comprising at least one anionic amphiphilic polymer optionally associated with at least one anionic surfactant; at least one hydrophilic active
25 substance being present in the internal aqueous phase; and at least one active substance being present in soluble form, solubilized or in the form of a solid dispersed in the external aqueous phase, or being present in the external oily phase.
